

So, you have your data...

- Descriptive statistics (mean, median, \% satisfied, etc.)
- Across cohorts (unit, faculty, time)
- Are observed differences real or the result of chance?
- What factors are driving the results?
- What do students consider to be important?

## Statistical significance

- Not due only to random chance in the sample
- Function of sample size and effect size
- Statistical precision increases with the square root of the sample size
- "Yay, the significance level is $p<0.001$ !!"
- Statistical vs practical significance
- Confidence intervals
- No overlap = statistically significant
- Not a replacement for formal hypothesis test
- Finite population correction*

## Without confidence intervals...

## With confidence intervals...

Univariate vs multivariate analysis

- Two approaches to statistical analysis:
- Univariate: one variable (description)
- Multivariate: two or more variables (explanation)
- Dependent and independent variables
- Confounding variables influence both the DV and IV
- Spurious correlation
- Stratification; i.e. dividing your sample into (relatively) homogeneous groups according to a confounding variable

Multivariate research questions

- What characteristics are associated with student satisfaction?
- Did average satisfaction scores in a unit change significantly between 2017 and 2018, accounting for changes in student composition?
- How do satisfaction scores in a unit compare to other units, accounting for differences in student composition across units?
- What educator characteristics are associated with teaching scores, accounting for differences in units taught?

Regression analysis

- Process for estimating the relationship between a dependent variable, and one or more independent variables (or 'predictors')
- Continuous or quasi-continuous outcome (e.g. psychometric scale): linear regression
- Binary (yes/no) outcome (e.g. satisfaction indicator): logistic regression
- Other related techniques:
- Quantile regression (median)
- Ordinal regression
- Multinomial regression

How are variables entered?

- Continuous variables entered as linear effects:
- "What is the effect on $y$ of a one-unit increase in $x$ ?"
- Categorical variables must be entered as indicator (i.e. dummy) variables:
- Coded $1=$ yes and $0=$ no; e.g. sex might be coded as $1=$ female and $0=$ male
- "What is the effect of being female (relative to male)?"
- For categorical variables of $>2$ categories, include $k$ - 1 dummy variables, where $k$ is the number of categories.

## Student experience by university

Unconditional Teaching Quality estimates

Conditional Teaching Quality estimates

| Group | Model (1) |  |
| :--- | :--- | :--- |

What do students consider to be important?

- Useful in terms of optimal allocation of scarce resources
- Explicit importance: asked directly
- Implicit performance: derived statistically
- Model overall satisfaction (for example) as a function of other survey items
- Derived importance cannot account for differences across individuals

Student experience dimensions underpinning overall satisfaction

Satisfaction with teaching quality increases the odds of overall satisfaction nearly tenfold.
All five dimensions have a significant positive impact on overall satisfaction.
Similar results observed across student cohorts (e.g. domestic/international; UG/GPG).

Teaching quality items underpinning overall satisfaction

## Explicit vs implicit (derived) importance

| High | (3) <br> High Implicit Importance/Low Explicit Importance = Excitement Factors | (2) <br> High Implicit Importance/High <br> Explicit Importance = <br> Performance Factors (Important) |
| :---: | :---: | :---: |
| Implicit Importance (Derived Importance) |  |  |
| Low | (2) <br> Low Implicit Importance/Low Explicit Importance $=$ Performance Factors (Unimportant) | (1) <br> Low Implicit Importance/High Explicit Importance $=$ Basic Factors |
|  | Low | High |
|  | Explicit Importance (Customers' self-stated importance) |  |

Conclusions

- Observed differences are not always real
- Real differences are not always relevant
- Beware confounding factors
- Students place different levels of importance on different facets of their university experience
- Use statistical methods to derive the most value from your data
