

# Evaluating Inclusive Clinical Skills with Large Video-Coding Datasets

Laura Weingartner, PhD, MS (she/her)

Andrew Rich (he/they)

Linda Fuselier, PhD (she/her)

University of Louisville School of Medicine

# Disclosures

Data collection and analysis for this project was funded by an Explorance Faculty Research Grant.

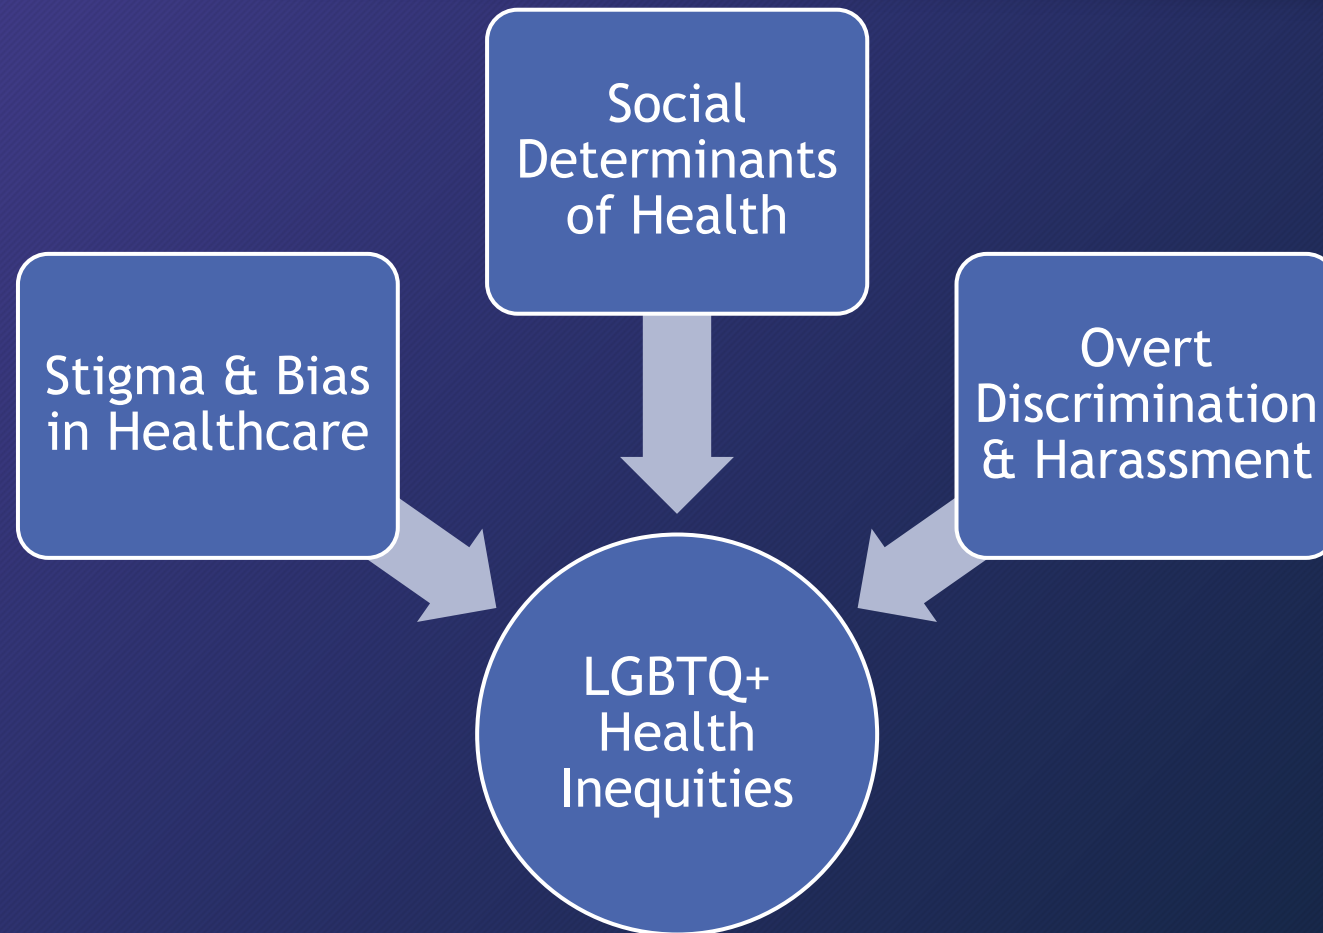

# Learning Objectives

After this presentation, attendees will be able to:

- Describe types of microaggressions that are commonly made by medical students during clinical skills assessments with LGBTQ+ standardized patients
- Identify a framework to evaluate LGBTQ+ microaggressions in healthcare training settings with large video-coding datasets
- Discuss opportunities to close the gaps related to LGBTQ+ microaggressions by assessing inclusive skills

# LGBTQ+ populations experience significant health disparities

# LGBTQ Health Disparities Snapshot

## Higher rates of:

Unemployment/Poverty

Bullying/Family rejection  
Interpersonal violence/Hate crimes

Anxiety/depression

Suicide attempts

Tobacco use

Substance abuse

Body image issues

Eating disorders

HIV and other STIs

Cancer

**Discrimination in Health Care**

## Lower rates of:

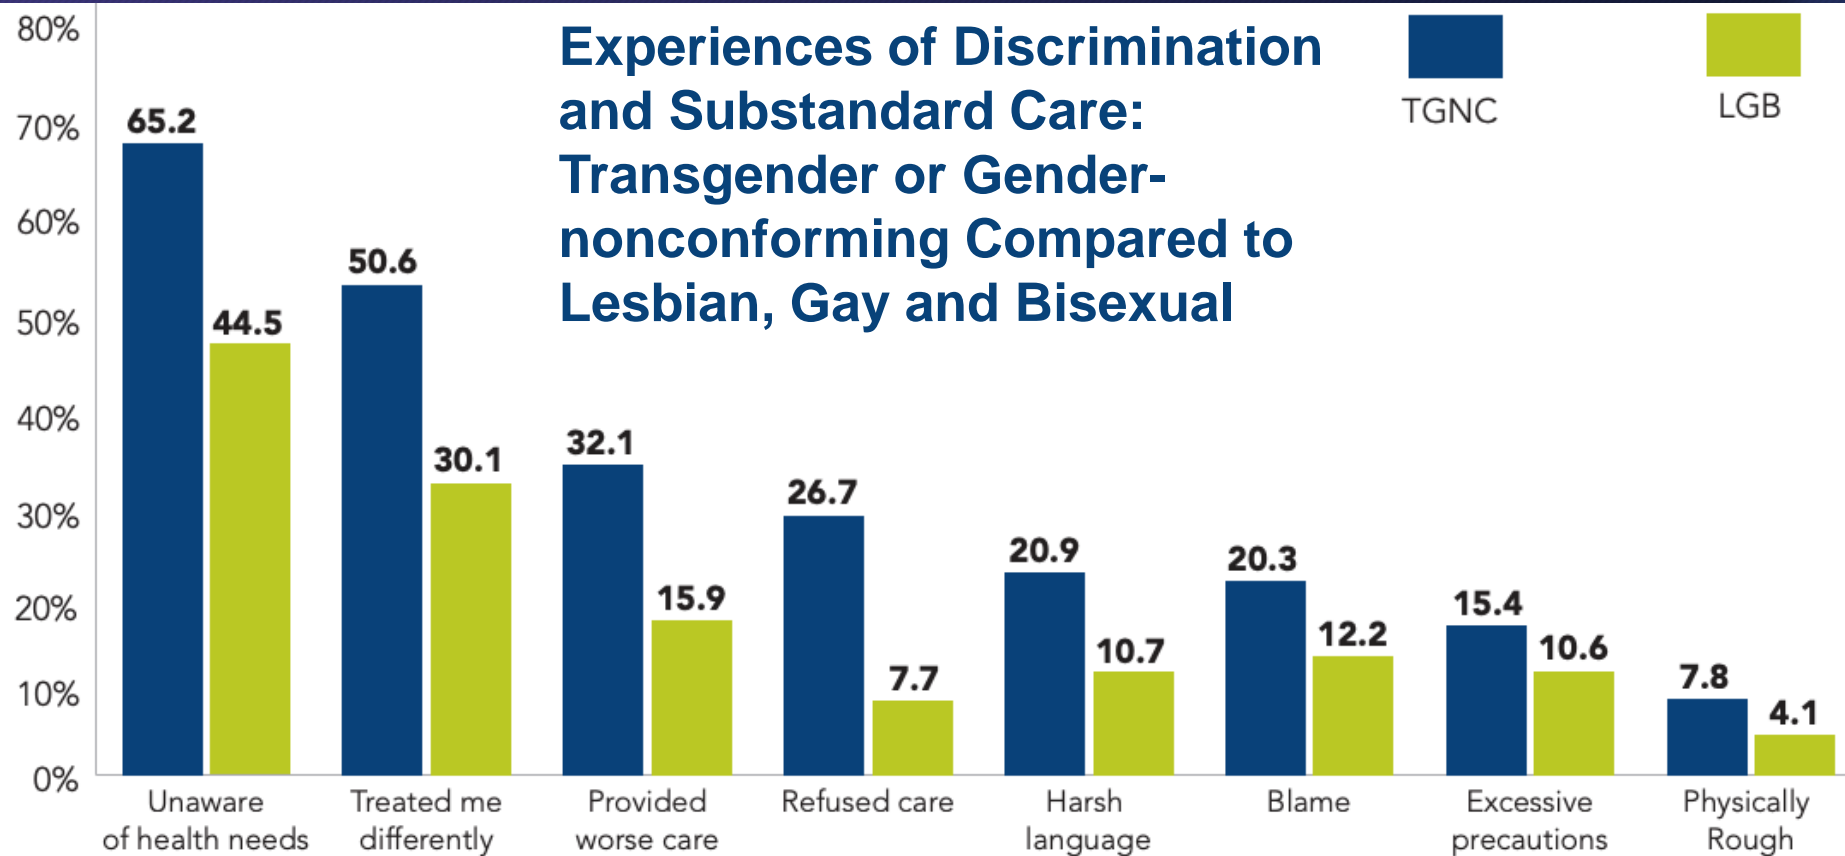

Health insurance

Preventive health care

Cancer screening

*Disparities most severe  
among trans communities  
and persons of color*

# Disparities are most severe among trans and gender-nonconforming communities

# Microaggressions

“Subtle form of discrimination, often unconscious or unintentional, that communicate hostile or derogatory messages, particularly to and about members of historically marginalized social groups.”

# Limitations of current microaggression studies

Broad focus outside of clinical settings

Focus on qualitative data

Scales require self-report

→ *We want a healthcare-specific measure that can be used for observation in medical training*

# Recorded Clinical Skills Assessments

Video Review

Record Control

Annotations

**RECORD CONTROL**

Activity: M3 Orientation - IRR ROUNDS 1-3

Case: Nichols Wed 6-14 training (New Pat)

Group: M3 Orientation Students

Inclusive Communication Skills

Gender-Affirming Care

Preventive Care

Social Determinants of Health

Sensitive Physical Exams

# Standardized Patient Assessment

- Standardized patient (SP) case with iterations varying only by gender identity and sex assigned at birth
- SPs establish primary care and report same health history to blinded students
- Weingartner et al. 2022 *MedEdPORTAL* Gender-Affirming Care with Transgender and Genderqueer Patients: A Standardized Patient Case to Identify Trainee Bias

Case Detail	Patient Case Iteration					
	Trans Man	Genderqueer Female SAAB	Cis Female	Trans Woman	Genderqueer Male SAAB	Cis Male
<i>Patient Pronouns</i>	<i>He/him</i>	<i>They/them</i>	<i>She/her</i>	<i>She/her</i>	<i>They/them</i>	<i>He/him</i>
<i>Patient Sex Assigned At Birth</i>	<i>Female</i>			<i>Male</i>		
<i>Current Sexual Partner SAAB</i>	<i>Male</i>					<i>Female</i>
<i>Previous Sexual Partners SAAB</i>	<i>Male &amp; Female</i>		<i>Male</i>	<i>Male &amp; Female</i>		<i>Female</i>
<i>Patient Sexual Orientation</i>	<i>Queer</i>		<i>Straight</i>	<i>Queer</i>		<i>Straight</i>
<i>Hormone Use</i>	<i>Testosterone</i>		<i>Estrogen</i>			<i>Testosterone</i>
<i>Reason for Hormone Use</i>	<i>Masculinize</i>		<i>Acne</i>	<i>Feminize</i>		<i>Gain muscle</i>

# Standardized Patient Assessment

## Cohort of Gender Diverse and Cisgender SPs

Transgender  
Women  
3 SPs

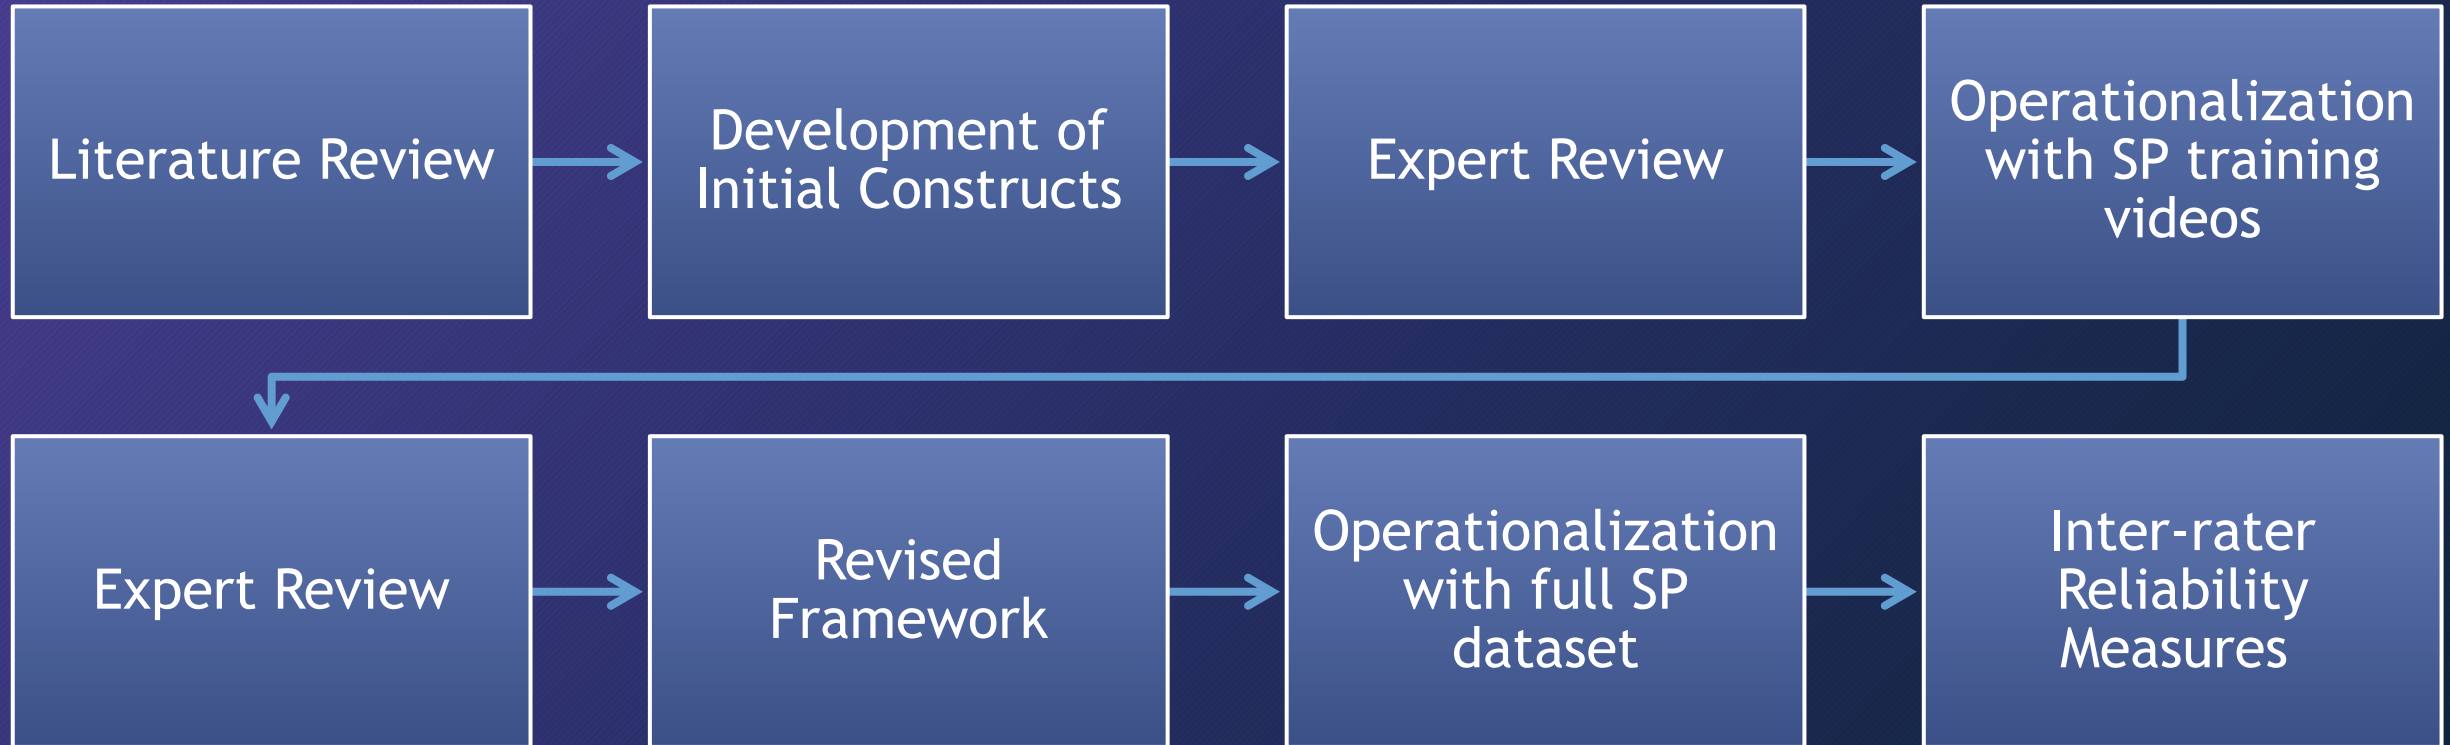

Transgender  
Men  
4 SPs

Genderqueer  
Individuals  
6 SPs

Cisgender  
Women  
4 SPs

Cisgender  
Men  
3 SPs

# Microaggressions Framework Development

# Secondary Analysis Training

Nine coders were trained to observe microaggressions with the framework

Coders + investigators classified a set (n=18) of microaggression descriptions

Group reached near-perfect level of inter-rater reliability (Krippendorff's  $\alpha = 0.92$ )

*= Microaggressions can be categorized reliably with this framework*

# Secondary Analysis Data Collection

Video coders sampled all recorded SP encounters

Coders described + classified each microaggression

Two coders reviewed to determine presence/absence

Inter-rater reliability measured with Kappa

Kappa statistic varies from 0 to 1, where:

0 = agreement equivalent to chance

0.1 – 0.20 = slight

0.21 – 0.40 = fair

0.41 – 0.60 = moderate

---

0.61 – 0.80 = substantial

0.81 – 0.99 = near perfect

1 = perfect agreement

*= Microaggressions can be observed reliably with this framework*

# Framework

- We identified 8 items around LGBTQ+ healthcare microaggressions.

*Heteronormative / Cisnormative Language or Assumptions*

*Lack of Foundational Knowledge About Sexual Orientation or Gender Identity*

*Noticeable Discomfort Related to Sexual Orientation or Gender Identity*

*Referral to Another Provider Based on Sexual Orientation or Gender Identity*

*Stereotypes about Sexual Orientation or Gender Identity*

*Incorrect Identifying Information*

*Excessive Focus on Sexual Orientation or Gender Identity*

*Homophobic or Transphobic Language*

# Framework Constructs

**Heteronormative /  
Cisnormative  
Language or  
Assumptions**  
( $\kappa = 0.80$ )

Using biased language in which  
LGBTQ+ identities are implied  
as unnatural or abnormal

*Example: a student assumed that a  
masculine-presenting transgender man  
was cisgender and discussed prostate  
screening recommendations.*

# Framework Constructs

## Lack of Foundational Knowledge About Sexual Orientation or Gender Identity

( $\kappa = 0.61$ )

Communicating a lack of knowledge about LGBTQ+ identities and/or related healthcare needs, often requiring education from the patient

*Example: The student told the patient that when it comes to transgender identities, "I always get confused, and I'm like 'What's going on?'"*

# Framework Constructs

**Noticeable  
Discomfort Related to  
Sexual Orientation or  
Gender Identity**  
( $\kappa = 0.85$ )

Displaying discomfort such as tense body language, difficulty speaking, or avoiding eye contact

*Example: After learning the patient's identity as a transgender woman, the student stopped the conversation, stared at the patient for a few seconds, laughed nervously, apologized, and then asked patient for her pronouns.*

# Framework Constructs

**Referral to Another  
Provider Based on  
Sexual Orientation or  
Gender Identity**

( $\kappa = 0.91$ )

Referring LGBTQ+ patients for care that could otherwise be completed by the provider

*Example: After telling the patient that he “doesn't know anything about transgender health care,” the student then referred the patient to endocrinology.*

# Framework Constructs

## **Stereotypes about Sexual Orientation or Gender Identity**

( $\kappa = 0.82$ )

Applying a generalized conception of LGBTQ+ identities while talking with the patient or making decisions about health services or needs

*Example: After the patient disclosed his identity as a transgender man in a relationship with a man, the student prompted the patient for STI/HIV testing without first discussing the patient's sexual health practices.*

# Framework Constructs

## Incorrect Identifying Information

( $\kappa = 0.67$ )

Misgendering, misnaming, or addressing a patient with incorrect honorifics verbally or within health records

*Example: Student assumed incorrect honorifics (“Hi Ms. Nichols”) at the start of an encounter with a patient who identified as genderqueer.*

# Framework Constructs

**Excessive Focus on  
Sexual Orientation or  
Gender Identity**

( $\kappa = 0.73$ )

Overattributing health concerns to or spending a disproportionate amount of time discussing a patient's identity

*Example: Without giving the patient context, the student asked a transgender patient whether friends and family knew about his transition and how they felt about his transition, which was perceived to be curiosity-driven.*

# Framework Constructs

## Homophobic or Transphobic Language

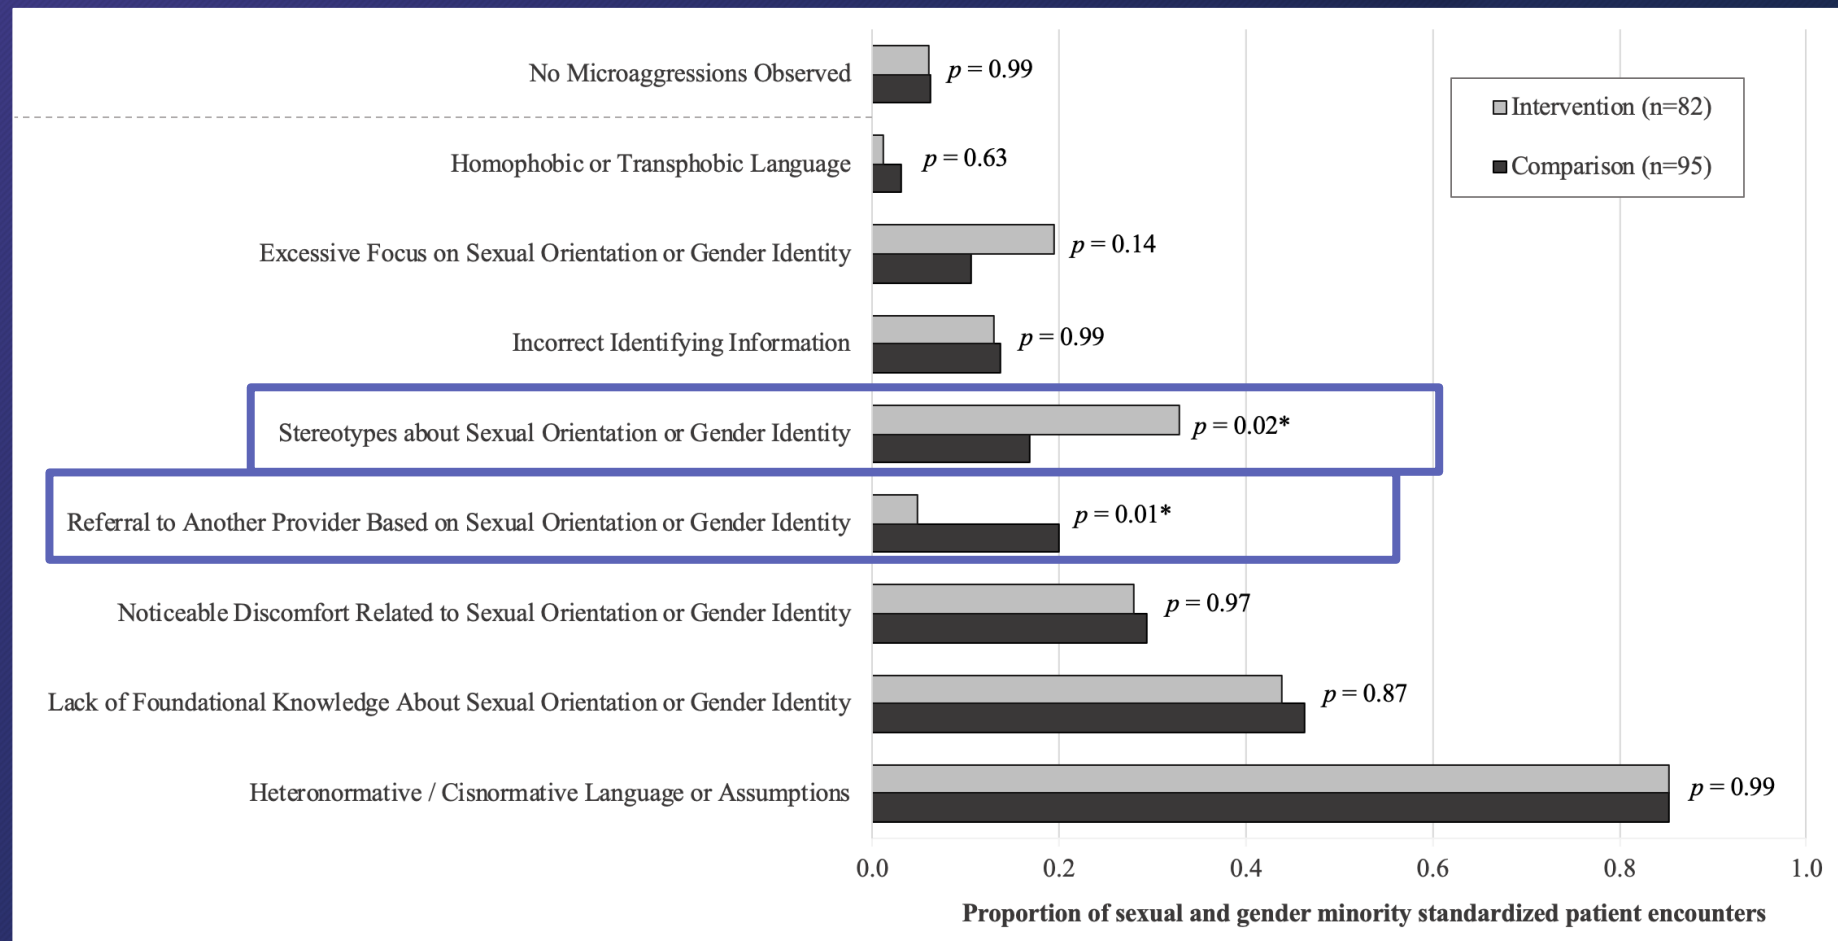

( $\kappa = 0.71$ )

Implying or stating that LGBTQ+ identity is invalid or shameful

*Example: Student was unwilling to prescribe hormones because of personal beliefs: "I think we were made with a certain gender and trying to change that...is in violation of the way that things were supposed to work, so I'm not able to help you with those medications."*

# Outcomes: Little effect on subtle biases

- Microaggressions observed in nearly all encounters (94%)
- Hetero/ cisnormative language and assumptions are most common (85%)

# Implications & Mitigation

*Create clinical skills assessment expectations for students to:*

Collect name, pronouns, sexual orientation, and gender identity for every patient

Ask open-ended questions in encounters

Ask patients about specific behaviors and risk factors before suggesting care

Use two-step gender identity questions

Connect specific risk factors, not identity, to recommendations

Ensure identity questions are directly related to care + explicitly explain connection to patients

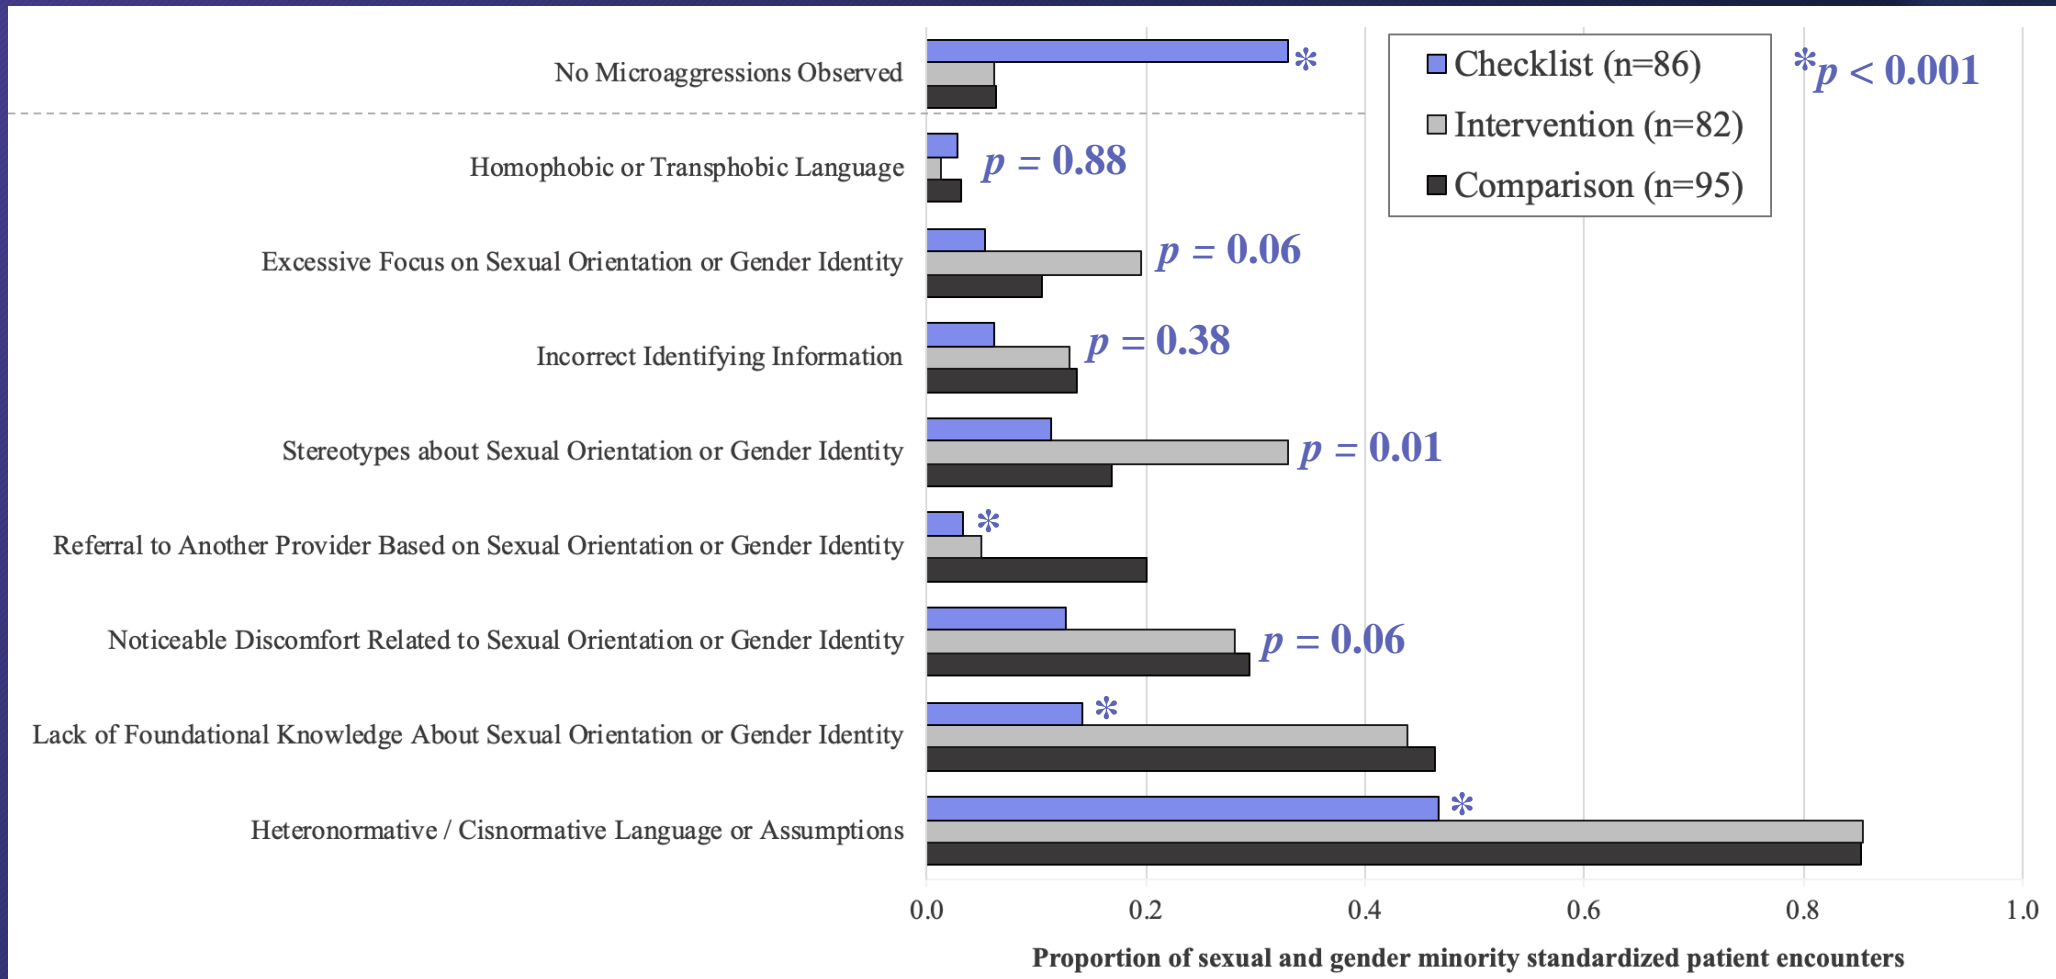

# After integrating inclusive clinical skills on checklist assessments

## Proportion of Encounters with Microaggressions

# Microaggressions decrease across categories after assessing clinical skills

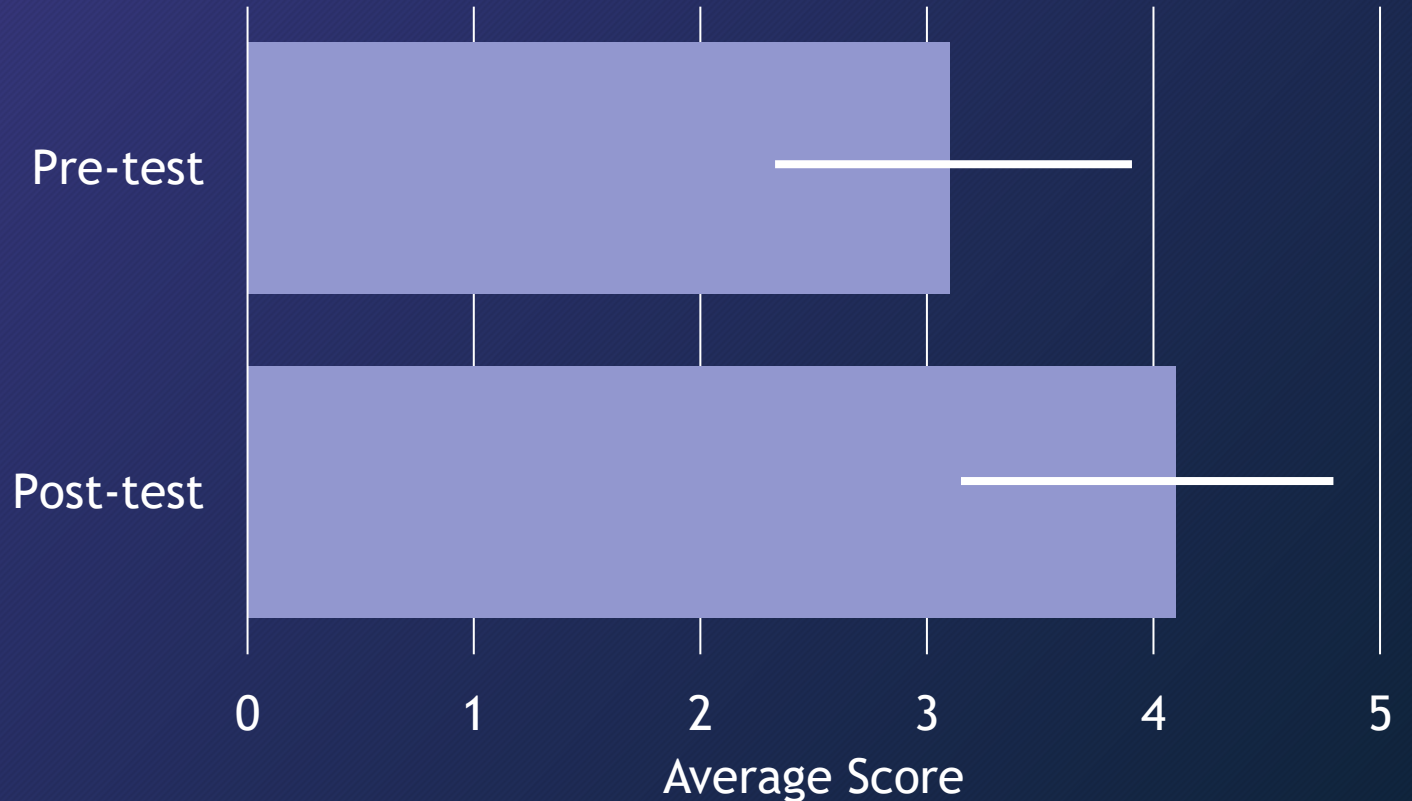

# Improved Coder LGBTQ+ Health Knowledge

**Identify Explicit Behaviors**

**Modeling**

**Normalize Skills**

$t = 2.2, p = 0.016$

# Conclusion & Reflection

LGBTQ+  
healthcare  
microaggressions  
are pervasive

Addressing  
microaggressions  
requires practice  
& accountability

Video coders  
benefit from  
evaluating  
clinical skills

# Future Directions

Do patient experiences align with observers?

Is there a dosage effect overall or from specific categories?

# Acknowledgments & Resources

- We thank Explorance and the Bluenotes Community for the Faculty Research Grant, which funded this project
- Thank you to Gita Jaikumar, Hayden Norris, Jacqueline Tran, Elisha Vanzant, Bhawana Yadav, Emily Noonan, and previous MERA students for coding efforts
